16 Day Prognosis Statement

A high covers the country today and tomorrow with a weak front passing over the south of the South Island. The high remains over much of New Zealand on Saturday and Sunday while a weakening front moves on to the South Island. The high still covers the North Island on Monday and Tuesday while a second front moves on to the South Island. The front decays over the North Island on Wednesday. Another front moves on to the South Island on Thursday and Friday then crosses the North Island on Saturday. More frontal activity reaches the south of the South Island on Sunday then forms in to a low on Monday. The low moves away to the east on Tuesday while a second low moves down towards the North Island. The second low moves away to the southeast on Wednesday while third low forms just to the north of the North Island. The low remains slow moving just to the north of the North Island on Thursday and Friday.

Trend Forecast and Commentary

SOI TREND: Last 30 days - 1.67 90 days - 5.78

The current trend is positive with the 90 day average expected to return to a neutral state for the next few months.

MJO MAY BREAK DRY SPELL: The long range weather model has decided to extend the high pressure over North Island for at least another week. This should extend the current dry spell affecting parts of the country. The passage of the MJO (A band of low pressure passing through the tropics), across seas to the north of New Zealand is expected to occur from the end of next week. The MJO lowers pressures over Northern Australia and the Northern Tasman Sea. Depressions often form in the lower pressure environment and move down on to the North Island. The passing MJO should give the country a better chance of receiving a significant rain event. Forecasters are also watchful with an increase risk of tropical cyclones in the Pacific as the MJO passes. This also heightens the risk of ex-tropical cyclones migrating southward on to New Zealand.
